Measuring AI ROI

The simple framework we use to prove the return on every automation we build — so you always know it's paying off.

What's inside

01	Three places AI returns money	03
02	Put a number on it	04
03	Track it honestly	05

INTRODUCTION

A system you can't measure is one you'll eventually stop trusting. This framework keeps it simple: every automation pays back in three ways, you put a conservative number on each, and you track the inputs before and after. The before-and-after gap is your proof.

CHAPTER 01

Three places AI returns money

Every automation pays back in one of three ways. Add them together for a clear, honest return you can defend to anyone.

1 Time saved

Hours your team no longer spends on manual work. Multiply hours saved per month by your loaded hourly cost.

2 Revenue gained

Deals you win that used to slip — faster replies, no missed leads, more follow-up. Count the extra revenue closed.

3 Cost avoided

Hires you didn't need, mistakes you didn't fix, tools you consolidated. Real money that stays in the business.

TIP

Track the inputs, not just the outcome. Pick 2–3 numbers per automation and measure them before and after.

CHAPTER 02

Put a number on it

$$\text{ROI} = (\text{Time saved} + \text{Revenue gained} + \text{Cost avoided} - \text{System cost}) \div \text{System cost}$$

Measured per month, then annualised.

Worked example. Say an automation saves 25 hours a month at SAR 75 loaded cost (SAR 1,875), recovers two deals worth SAR 1,500, and avoids SAR 3,000 of part-time help. That's SAR 7,875 of monthly value. If the system cost SAR 7,500 to build and SAR 500/month to run, it pays for itself in the first month and returns many times its running cost every month after.

TIP

Be conservative. An automation that clearly wins on cautious numbers is more convincing — and more durable — than one that only works on optimistic ones.

CHAPTER 03

Track it honestly

Pick a small set of inputs for each automation — response time, leads contacted, hours logged — and capture them before you launch and after. The difference is your ROI, in numbers you trust.

BEFORE YOU LAUNCH

- ☐ Choose 2–3 measurable inputs per automation.
- ☐ Record the baseline before go-live.
- ☐ Re-measure after 30 days and compare.
- ☐ Use conservative figures you can defend.

YOUR MOVE

See your numbers before you commit.

Book a free call and we'll estimate the return on your highest-impact automation — no guesswork.
